Demonstration: Joining Tables

- Demonstration: Joining Tables
 - 1. Create a new project, add the topproducts SAS data set.
 - 2. Add the **products** SAS data set to the project.
 - 3. Add the **country_lookup.xlsx** file to the project. Name the imported table **country_lookup** and select the **First row of range contains field names** check box. Do not make any changes to the field attributes.
 - 4. Right-click topproducts in the Project Tree or Process Flow and select Query Builder....

Demonstration: Joining Tables

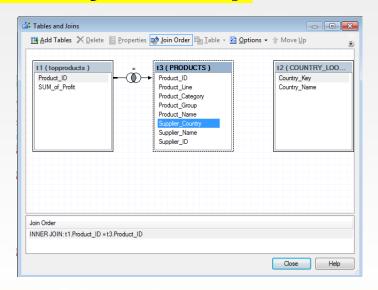

5. Name the query Top Products Info Query and the output table

topproductsinfo.

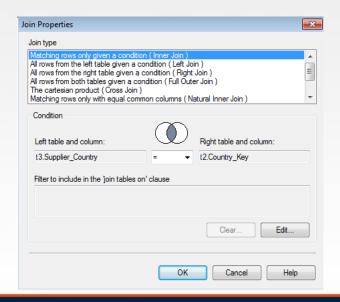

- Select Add Tables. Verify that the Project icon is select in the Open Data window. Hold down the CTRL key and select products and country_lookup tables. Select Open.
- 7. A message appears and indicates that SAS Enterprise Guide was unable to find matching columns on which to join in all three tables. Select OK.

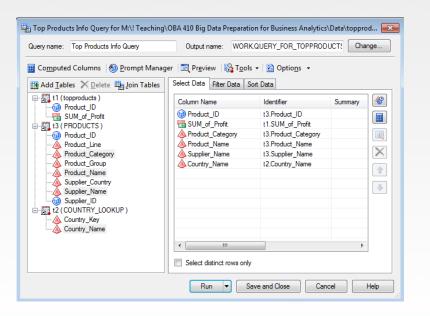

- Demonstration: Joining Tables
 - 8. The Tables and Joins window automatically opens. To join the **products** and **country_lookup** tables, first select **Supplier_Country** in the **products** table. Select **Supplier_Country** a second time and drag it to connect it to **Country_Key** in the **country_lookup** table.

- Demonstration: Joining Tables
 - 9. The Join Properties dialog box automatically opens. Verify that the join type is **Matching rows only given a condition (Inner Join)** and that the condition is **t2.Supplier_Country = t3.Country_Key**. Select **OK > Close** to return to the Select Data tab.

- Demonstration: Joining Tables
 - 10.Double-click on the following columns to add each to the Select Data tab: Product_ID, SUM_of_Profit, Product_Category, Product_Name, Supplier_Name, and Country_Name.

Demonstration: Joining Tables
10.Select Run to execute the query. Verify the results and save the project.
